Class differences in social networks: Evidence from a referral experiment

1-hour presentation

Manu Munoz[1] Ernesto Reuben[2,1] Reha Tuncer[3]

[1]Luxembourg Institute of Socioeconomic Research

[2]NYU Abu Dhabi

[3]University of Luxembourg

25 April 2025

Motivation

- Understand persistent class differences in labor the market, like the underrepresentation of Low-SES researchers in elite academic institutions (Stansbury and Rodriguez, 2024)
- Focus on the role of class biases in social networks and referrals

Motivation

- Understand persistent class differences in labor the market, like the underrepresentation of Low-SES researchers in elite academic institutions (Stansbury and Rodriguez, 2024)
- Focus on the role of class biases in social networks and referrals

Referrals and Social Networks

- About half of all jobs are found through referrals, making them critical for the labor market (Topa, 2011; Ioannides & Loury, 2004)
- Referrals depend on social networks, which exhibit strong homophily (McPherson et al., 2001; Smith, 2005)
- Two possible channels for class inequalities:
  - Network structure differences: unequal access to valuable connections (Lin et al., 1981; Mouw, 2003; Chetty et al., 2021)
  - Referral bias: differential treatment within existing networks (Kramarz & Skans, 2014; DiTomaso, 2013)

Referrals and Social Networks

- About half of all jobs are found through referrals, making them critical for the labor market (Topa, 2011; Ioannides & Loury, 2004)
- Referrals depend on social networks, which exhibit strong homophily (McPherson et al., 2001; Smith, 2005)
- Two possible channels for class inequalities:
  - Network structure differences: unequal access to valuable connections (Lin et al., 1981; Mouw, 2003; Chetty et al., 2021)
  - Referral bias: differential treatment within existing networks (Kramarz & Skans, 2014; DiTomaso, 2013)

Research Questions

- *Are class differences in labor market driven by biases in referrals or by network structure?*
- *Do network structures differ by social class?*
- *Are there social class biases in referrals beyond the network structure?*

Research Questions

- *Are class differences in labor market driven by biases in referrals or by network structure?*
- *Do network structures differ by social class?*
- *Are there social class biases in referrals beyond the network structure?*

Research Questions

- *Are class differences in labor market driven by biases in referrals or by network structure?*
- *Do network structures differ by social class?*
- *Are there social class biases in referrals beyond the network structure?*

Setting

- Universidad Autónoma de Bucaramanga (UNAB)
- Approx. 6000 students across all social classes
- Administrative data including SES, age, program, GPA, courses attended, year of entry, and the entry exam scores

Setting

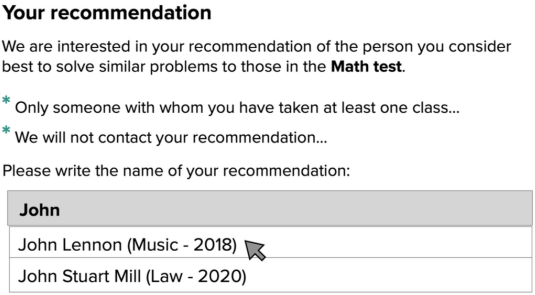
- Universidad Autónoma de Bucaramanga (UNAB)
- Approx. 6000 students across all social classes
- Administrative data including SES, age, program, GPA, courses attended, year of entry, and the entry exam scores

Setting

- Universidad Autónoma de Bucaramanga (UNAB)
- Approx. 6000 students across all social classes
- Administrative data including SES, age, program, GPA, courses attended, year of entry, and the entry exam scores

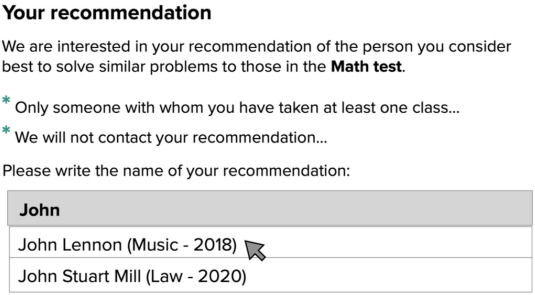
Design: Referrals and Network

- Ask students to refer someone they have taken at least one course with
- Observe the entire co-enrollment network at UNAB



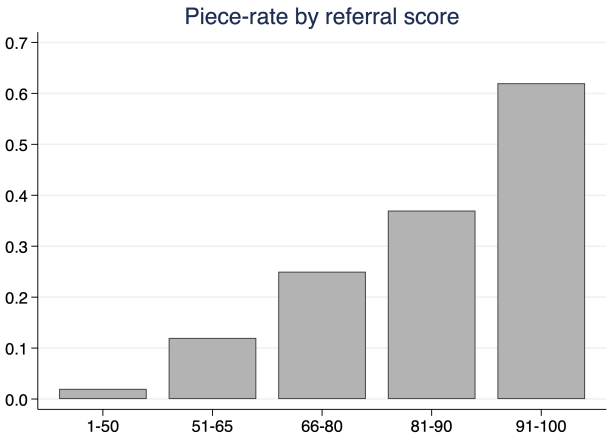
Design: Referrals and Network

- Ask students to refer someone they have taken at least one course with
- Observe the entire co-enrollment network at UNAB



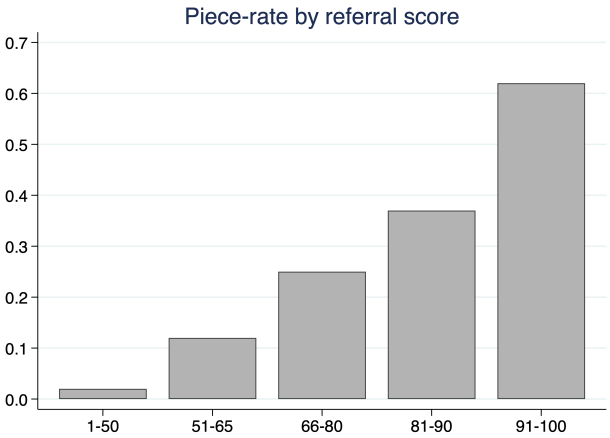
Design: Incentives and Treatment

- Pay according to the student's math and verbal scores in the national entry exam
- Incentivize better refferals by increasing monetary reward as referral score goes higher
- Treatments: Baseline vs. Bonus for the referral



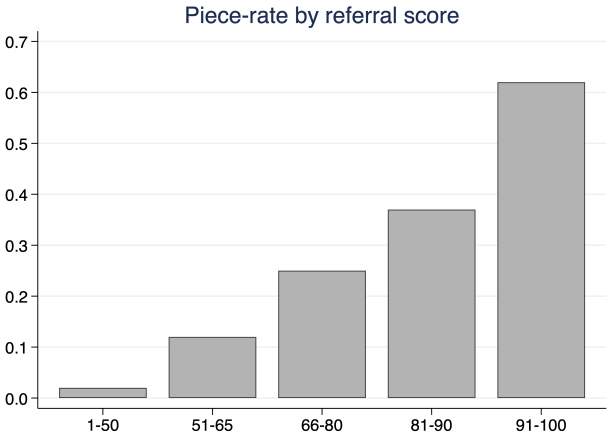
Design: Incentives and Treatment

- Pay according to the student's math and verbal scores in the national entry exam
- Incentivize better refferals by increasing monetary reward as referral score goes higher
- Treatments: Baseline vs. Bonus for the referral



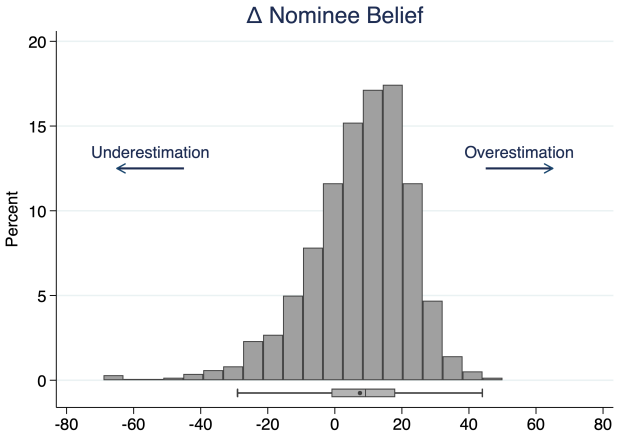
Design: Incentives and Treatment

- Pay according to the student's math and verbal scores in the national entry exam
- Incentivize better refferals by increasing monetary reward as referral score goes higher
- Treatments: Baseline vs. Bonus for the referral



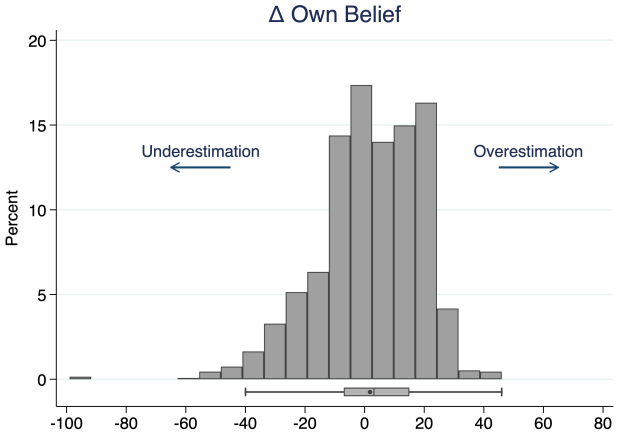
Beliefs about nominees reveal a positive bias

- Defined as referrer *i*'s beliefs about nominee *j* minus *j*'s score across Math and Reading
- No difference between SES groups See
- Did not collect beliefs about SES group performance in general



Beliefs about own scores are accurate

- Defined as referrer *i*'s own beliefs minus their score across Math and Reading
- No difference between SES groups See



Procedures

- Recruited participants by emailing 4500 students (>1st year)
- 30 minute online experiment in Qualtrics
- Average payment of 8 USD
- 840 complete responses
- Final sample 734 participants who referred someone they took a course with

Procedures

- Recruited participants by emailing 4500 students (>1st year)

Balance between treatments

- Successful randomization

	Baseline	Bonus	p
Reading score	64.712	65.693	0.134
Math score	67.366	67.597	0.780
GPA	4.003	4.021	0.445
Connections	173.40	176.88	0.574
Courses taken	3.939	3.719	0.443
Low-SES	0.419	0.401	0.615
Med-SES	0.492	0.506	0.714
High-SES	0.089	0.094	0.824
Observations	382	352	734

Network size and tie strength

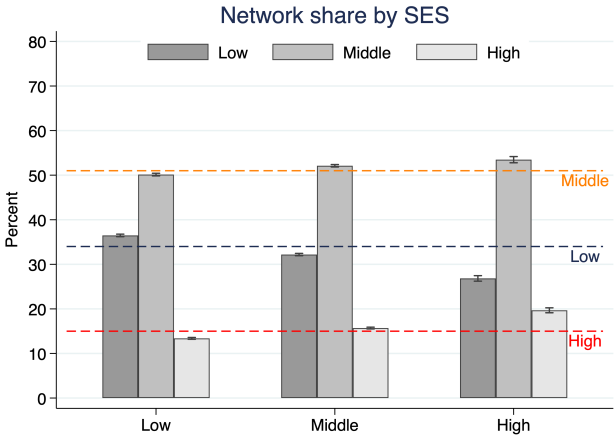
- Courses taken with peers increase over time
- Connections peak around 7 semesters and decline as students change majors or graduate

Network size and tie strength

- Courses taken with peers increase over time
- Connections peak around 7 semesters and decline as students change majors or graduate

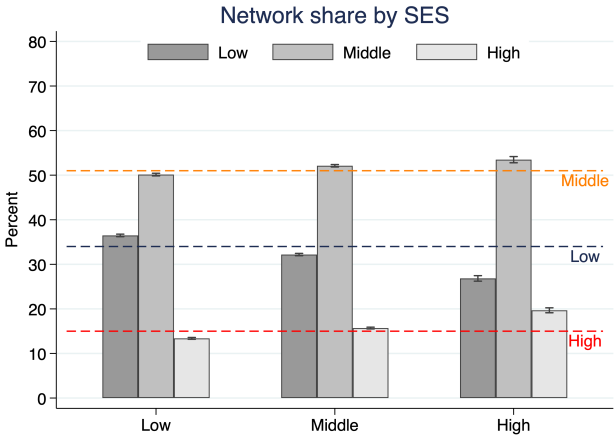
Network-level SES shares

- 51 % of UNAB is **Middle-SES**, 35 % **Low-SES**, and 15 % **High-SES**
- Network shares are very different from the UNAB population
- Why?



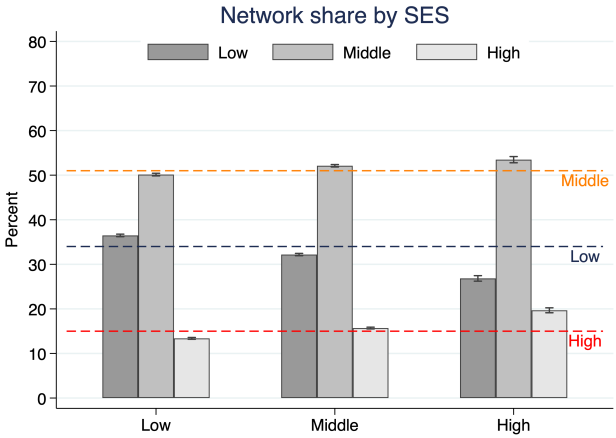
Network-level SES shares

- 51 % of UNAB is **Middle-SES**, 35 % **Low-SES**, and 15 % **High-SES**
- Network shares are very different from the UNAB population
- Why?



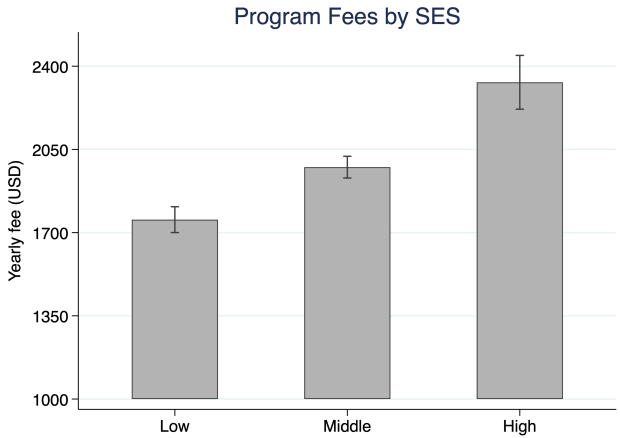
Network-level SES shares

- 51 % of UNAB is **Middle-SES**, 35 % **Low-SES**, and 15 % **High-SES**
- Network shares are very different from the UNAB population
- Why?



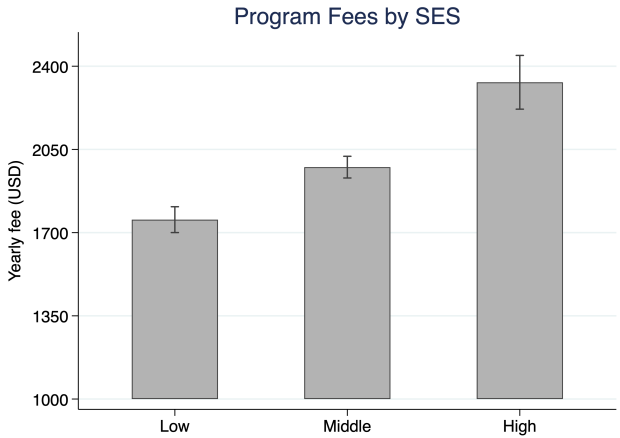
Selection into programs

- Low-SES study in more affordable programs
- Large difference as net average monthly salary around $350



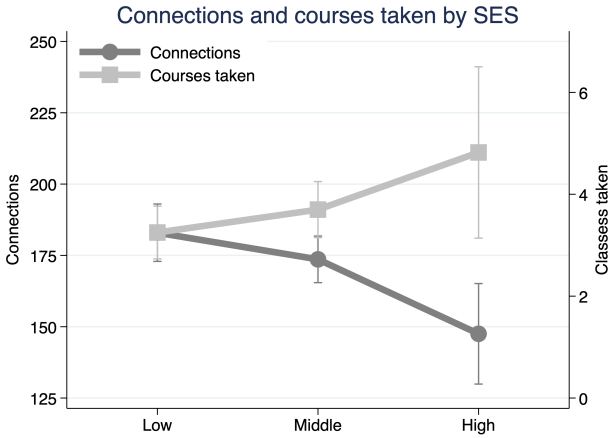
Selection into programs

- Low-SES study in more affordable programs
- Large difference as net average monthly salary around $350



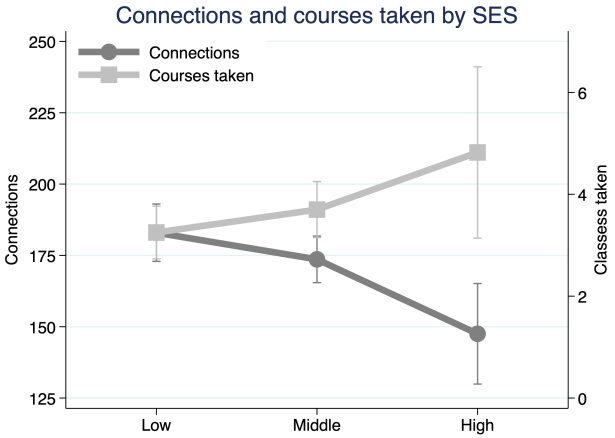
Network dynamics and program selection

- Connections decrease with SES
- Courses taken with peers increases with SES



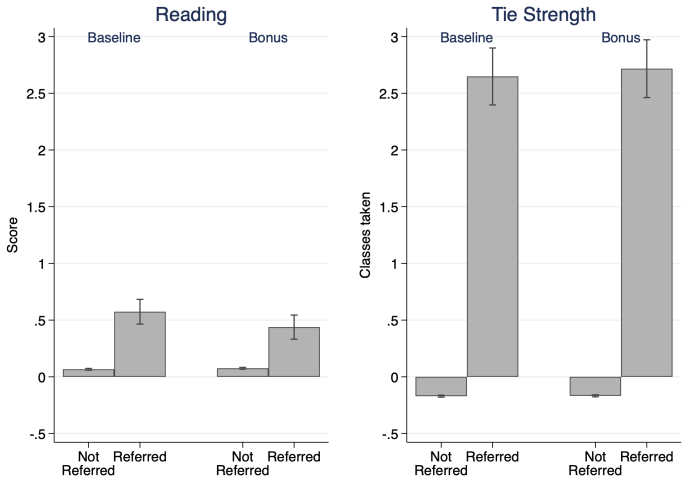
Network dynamics and program selection

- Connections decrease with SES
- Courses taken with peers increases with SES



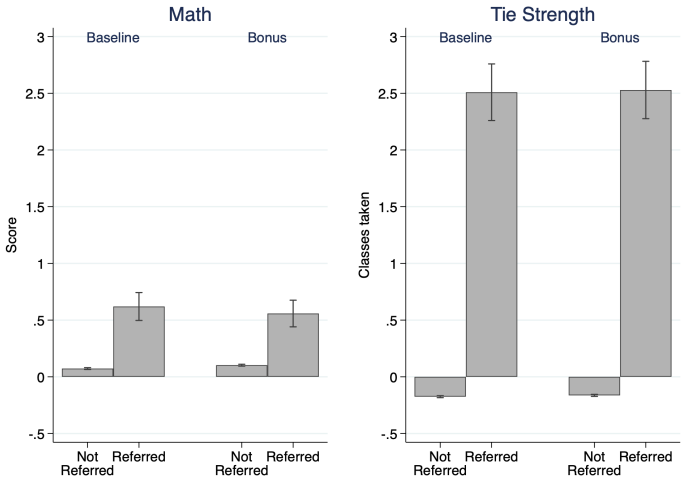
Referrals for Reading

- Referrals have higher reading scores and much higher tie strength
- No treatment effect on the referred (t-tests, $p > 0.08$)



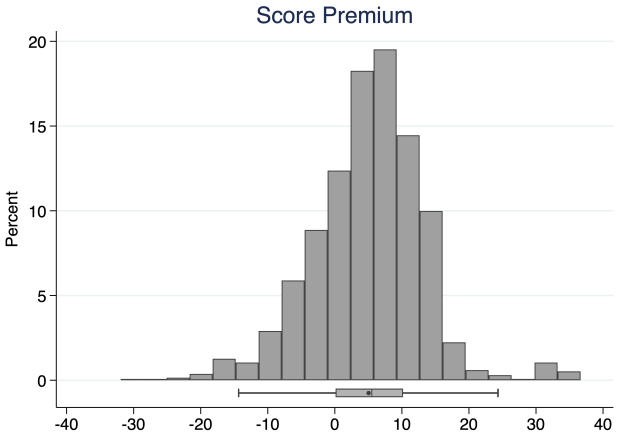
Referrals for Math

- Referrals have higher math scores and much higher tie strength
- No treatment effect on the referred (t-tests, $p > 0.1$)



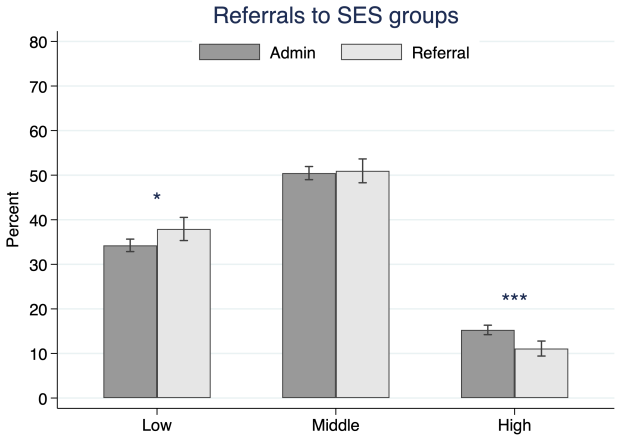
Referrals are better than network average

- Defined as nominee *j*'s score minus network average for each referrer *i* across Math and Reading
- No difference between SES groups See



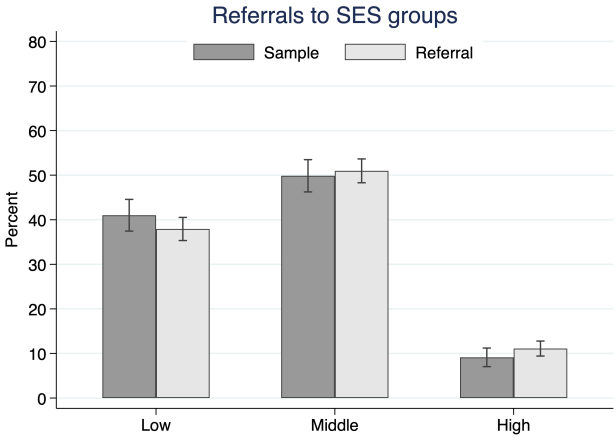
Referrals are balanced

- More referrals for Low-SES and less for High-SES compared to the admin data
- No differences at the sample-level (all $p > 0.1$)



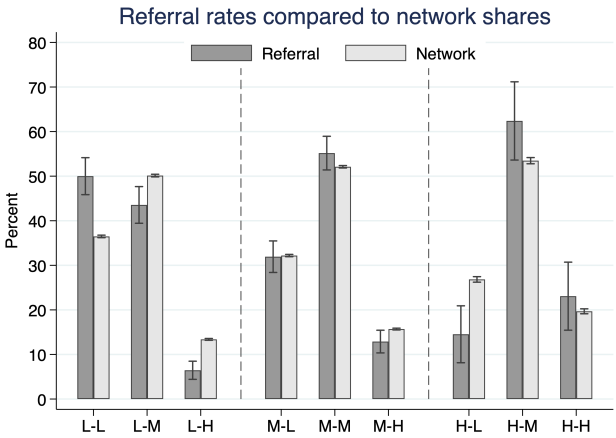
Referrals are balanced

- More referrals for Low-SES and less for High-SES compared to the admin data
- No differences at the sample-level (all $p > 0.1$)



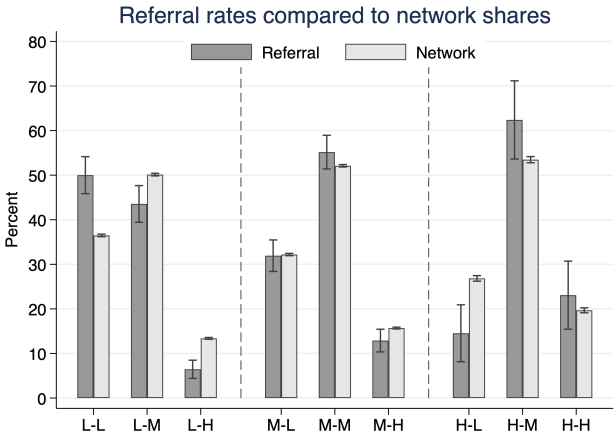
Referral SES composition

- Stark differences in referral rates considering network compositions were imbalanced to begin with
- Do differences persist after fixing scores and classes taken?



Referral SES composition

- Stark differences in referral rates considering network compositions were imbalanced to begin with
- Do differences persist after fixing scores and classes taken?



Is there a SES bias in referrals?

Conditional FE Logit:

$$\Pr(\text{Refer}_{ij} = 1) = \Lambda\left(\beta_1 \text{SES}_j + \beta_2 \text{Score}_j + \beta_3 \text{Courses taken}_{ij} + \beta_4 \text{Score}_j \times \text{Tie}_{ij} + \alpha_i\right)$$

- Refer_{ij}: Binary outcome indicating whether individual i refers individual j
- SES_j: Referral j is Low, Middle, or High SES
- Score_j: Standardized Math or Reading score of referral j
- $\text{Courses taken}_{ij}$: Standardized number of courses taken together for i and j
- α_i: Individual fixed effect for referrer i

Is there a SES bias in referrals?

- Aggregate bias against High-SES
- Score and courses taken are strong predictors of referrals
- Small interaction between score and courses taken

	(1)	(2)	(3)

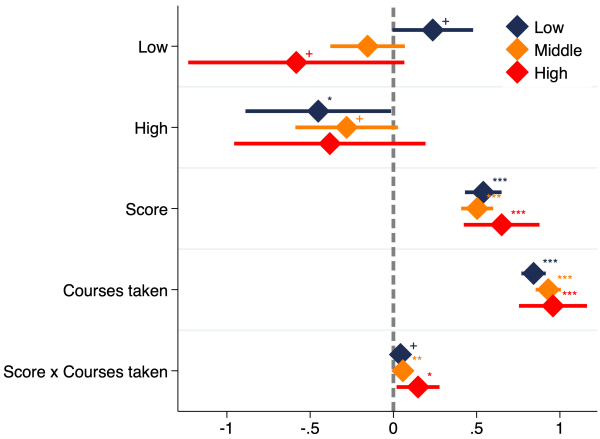
Observations	19767	19767	19767
Ind.	67	67	67
Chi-test	4.94	120.54	144.77

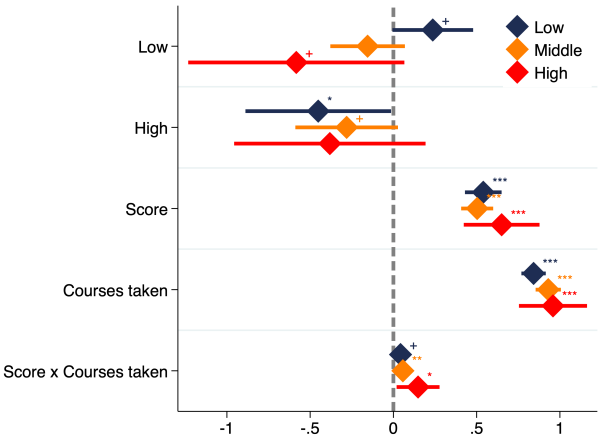
No bias against Low-SES in referrals

- **Low-SES** referrers are biased against High-SES and favor their own
- **Middle-SES** referrers are marginally biased against High-SES
- **High-SES** referrers are marginally biased against Low-SES but do not favor their own



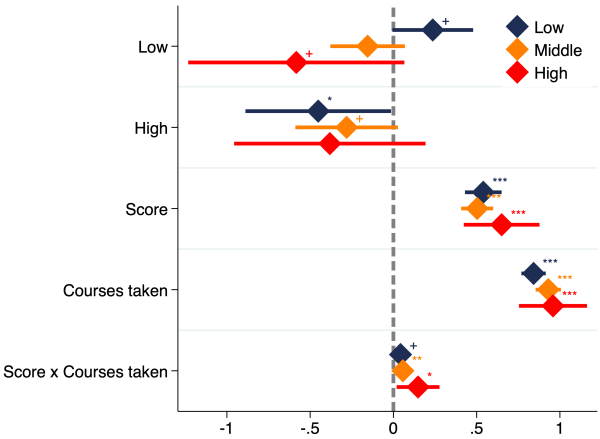
No bias against Low-SES in referrals

- **Low-SES** referrers are biased against High-SES and favor their own
- **Middle-SES** referrers are marginally biased against High-SES
- **High-SES** referrers are marginally biased against Low-SES but do not favor their own



No bias against Low-SES in referrals

- **Low-SES** referrers are biased against High-SES and favor their own
- **Middle-SES** referrers are marginally biased against High-SES
- **High-SES** referrers are marginally biased against Low-SES but do not favor their own



Summary

- Networks are separated by SES
- Referrers refer equally well across SES, and pick close ties with higher scores
- Little to no bias in referrals in contrast to stark differences in network structures

Summary

- Networks are separated by SES
- Referrers refer equally well across SES, and pick close ties with higher scores
- Little to no bias in referrals in contrast to stark differences in network structures

Summary

- Networks are separated by SES
- Referrers refer equally well across SES, and pick close ties with higher scores
- Little to no bias in referrals in contrast to stark differences in network structures

Conclusion

- Individuals across SES refer equally well . . .
- . . . but **prefer** nominating similar others in SES

Conclusion

- Individuals across SES refer equally well . . .
- . . . but **prefer** nominating similar others in SES

Reading

- Reading score and tie strength are strong predictors of referrals
- No interaction between reading score and tie strength
- No evidence for a Low-SES bias Alt. Specification
