<sup>3</sup>University of Luxembourg

8 May 2025

# Motivation

---

- Understand persistent class differences in labor the market, like the underrepresentation of Low-SES researchers in elite academic institutions (Stansbury and Rodriguez, 2024)
- Focus on the role of class biases in social networks and referrals

# Motivation

---

- Understand persistent class differences in labor the market, like the underrepresentation of Low-SES researchers in elite academic institutions (Stansbury and Rodriguez, 2024)
- Focus on the role of class biases in social networks and referrals

# Referrals and Social Networks

---

- About half of all jobs are found through referrals, making them critical for the labor market (Topa, 2011; Ioannides & Loury, 2004)
- Referrals depend on social networks, which exhibit strong homophily (McPherson et al., 2001; Smith, 2005)
- Two possible channels for class inequalities:
  - Network structure differences: unequal access to valuable connections (Lin et al., 1981; Mouw, 2003; Chetty et al., 2021)
  - Referral bias: differential treatment within existing networks (Kramarz & Skans, 2014; DiTomaso, 2013)

# Research Questions

---

- *Are class differences in labor market driven by biases in referrals or by network structure?*
- *Do network structures differ by social class?*
- *Are there social class biases in referrals beyond the network structure?*

# Research Questions

---

- *Are class differences in labor market driven by biases in referrals or by network structure?*
- *Do network structures differ by social class?*
- *Are there social class biases in referrals beyond the network structure?*

# Research Questions

- *Do network structures differ by social class?*
- *Are there social class biases in referrals beyond the network structure?*

# Setting

---

- Universidad Autónoma de Bucaramanga (UNAB)
- Approx. 6000 students across all social classes
- Administrative data including SES, age, program, GPA, courses attended, year of entry, and the entry exam scores

# Setting

---

- Universidad Autónoma de Bucaramanga (UNAB)
- Approx. 6000 students across all social classes
- Administrative data including SES, age, program, GPA, courses attended, year of entry, and the entry exam scores

# Setting

- Universidad Autónoma de Bucaramanga (UNAB)
- Approx. 6000 students across all social classes
- Administrative data including SES, age, program, GPA, courses attended, year of entry, and the entry exam scores

# Design I: Referrals and Network

---

- Ask students to refer someone they have taken at least one course with
- Observe the entire co-enrollment network at UNAB

## Your recommendation

We are interested in your recommendation of the person you consider best to solve similar problems to those in the **Math test**.

- \* Only someone with whom you have taken at least one class...
- \* We will not contact your recommendation...

Please write the name of your recommendation:

John

John Lennon (Music - 2018) 

John Stuart Mill (Law - 2020)

# Design I: Referrals and Network

## Design II: Incentives

---

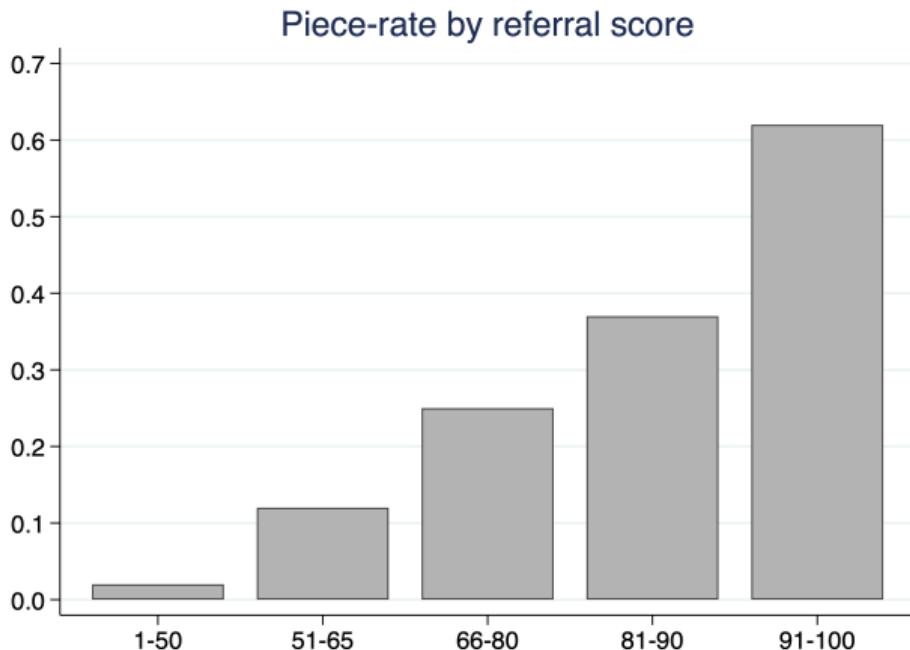

- Pay according to the student's math and verbal scores in the national entry exam
- Incentivize better referrals by increasing monetary reward as referral score goes higher

## Design II: Incentives

---

- Pay according to the student's math and verbal scores in the national entry exam
- Incentivize better referrals by increasing monetary reward as referral score goes higher

# Design III: Treatment

---

- **Baseline:** Pay by referral score (Merit)
- **Bonus:** Pay by referral score and a fixed sum for the referred network member (Social concern)

## Design III: Treatment

---

- **Baseline:** Pay by referral score (Merit)
- **Bonus:** Pay by referral score and a fixed sum for the referred network member (Social concern)

# Procedures

---

- Recruited participants by emailing 4500 students (>1st year)
- 30 minute online experiment in Qualtrics
- Average payment of 8 USD
- 840 complete responses
- Final sample 734 participants who referred someone they took a course with

# Procedures

---

- Recruited participants by emailing 4500 students (>1st year)

# Balance between treatments

---

- Successful randomization

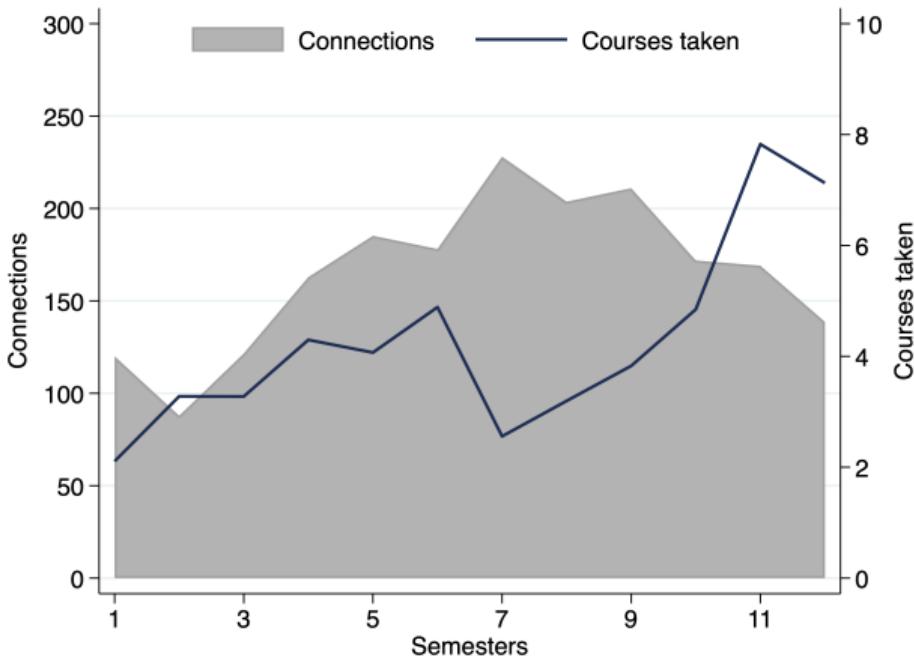

|               | Baseline | Bonus  | p     |
|---------------|----------|--------|-------|
| Reading score | 64.712   | 65.693 | 0.134 |
| Math score    | 67.366   | 67.597 | 0.780 |
| GPA           | 4.003    | 4.021  | 0.445 |
| Connections   | 173.40   | 176.88 | 0.574 |
| Courses taken | 3.939    | 3.719  | 0.443 |
| Low-SES       | 0.419    | 0.401  | 0.615 |
| Med-SES       | 0.492    | 0.506  | 0.714 |
| High-SES      | 0.089    | 0.094  | 0.824 |
| Observations  | 382      | 352    | 734   |

# Descriptive Statistics I: Network

# Network size and tie strength

---

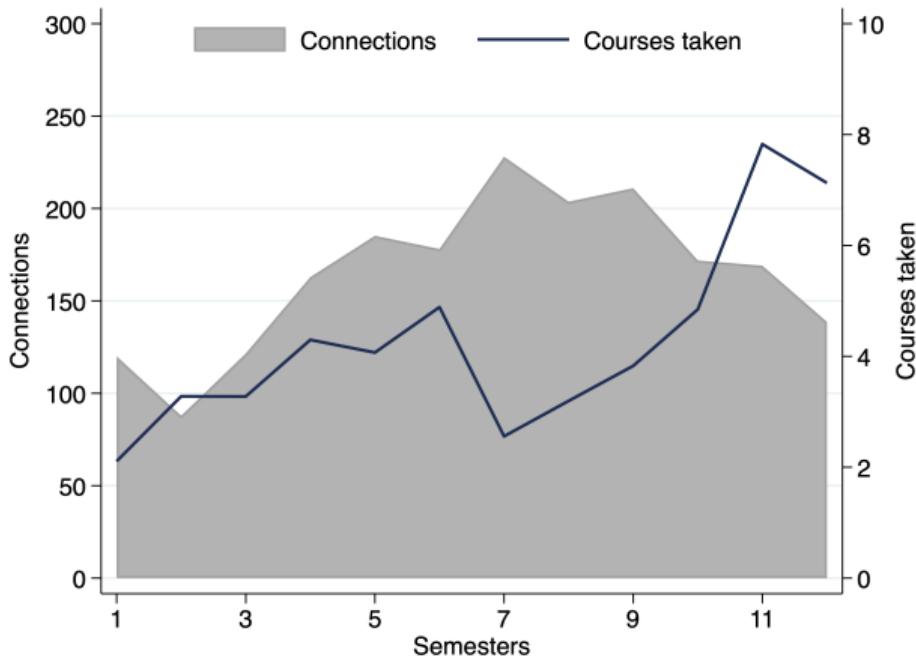

- Connections peak around 7 semesters and decline as students change majors or graduate
- Courses taken with peers increase over time

# Network size and tie strength

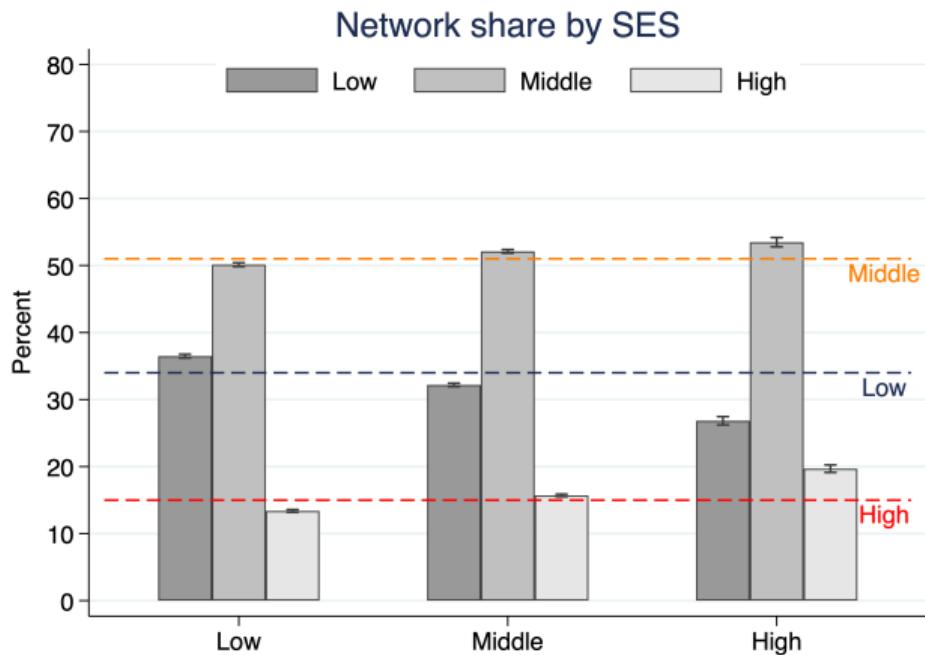

---

- Connections peak around 7 semesters and decline as students change majors or graduate
- Courses taken with peers increase over time

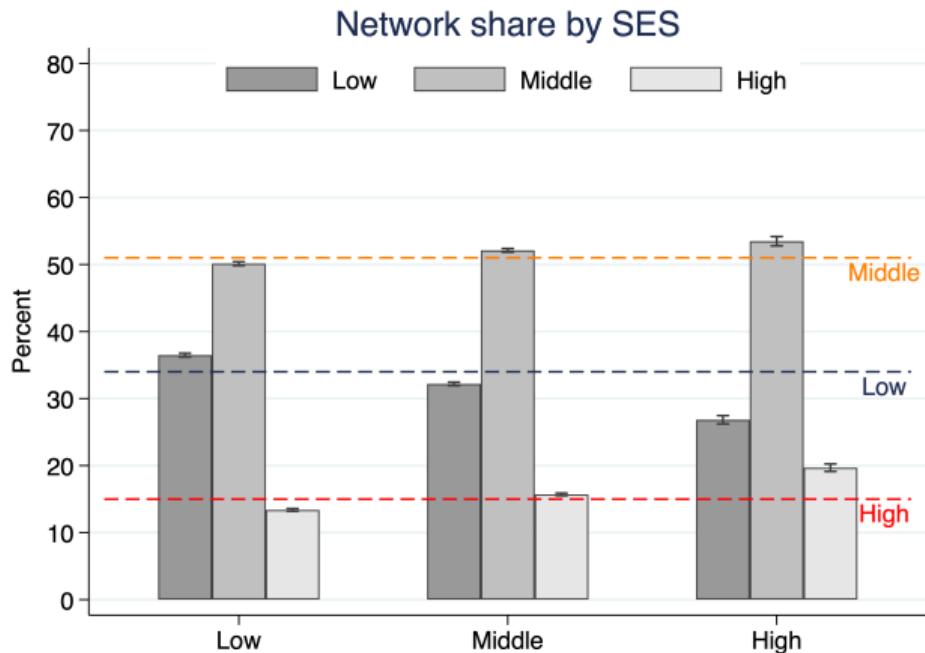

# Network-level SES shares

- 51 % of UNAB is **Middle-SES**, 35 % **Low-SES**, and 15 % **High-SES**
- Network shares are very different from the UNAB population
- Why?

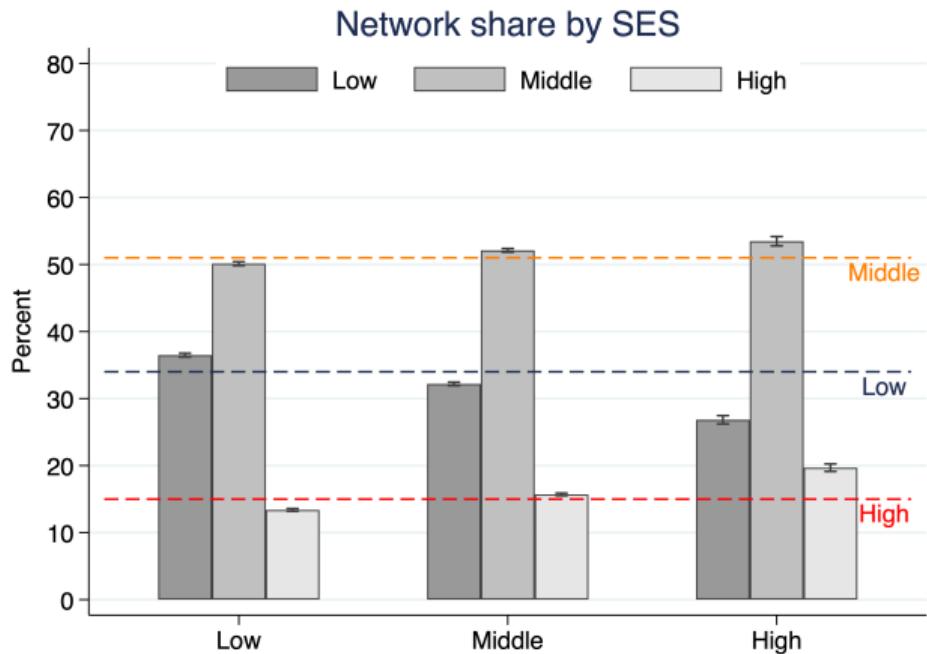

# Network-level SES shares

- 51 % of UNAB is **Middle-SES**, 35 % **Low-SES**, and 15 % **High-SES**
- Network shares are very different from the UNAB population
- Why?

# Network-level SES shares

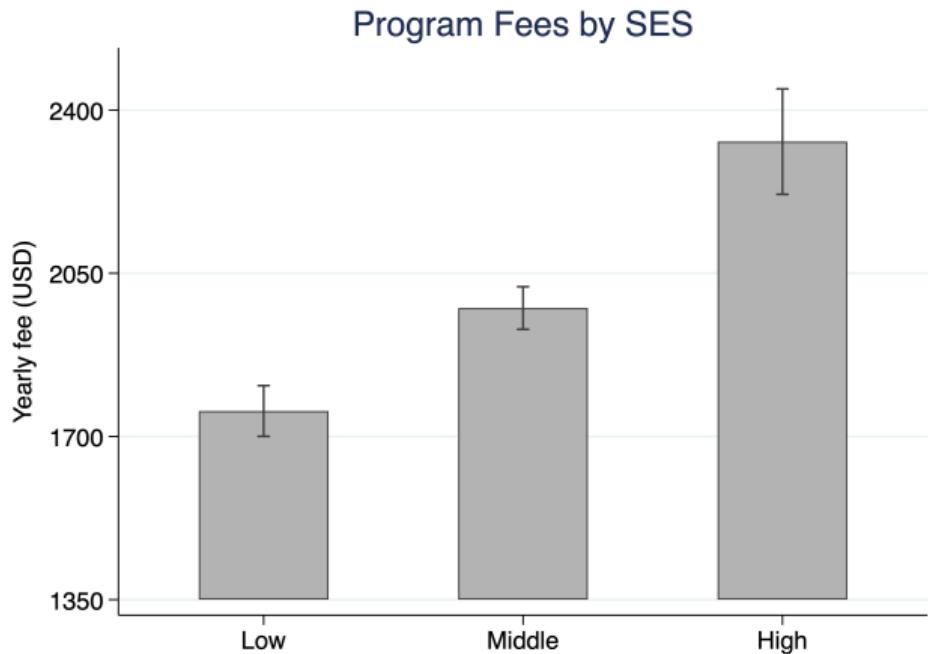

- 51 % of UNAB is **Middle-SES**, 35 % **Low-SES**, and 15 % **High-SES**
- Network shares are very different from the UNAB population
- Why?

# Selection into programs

---

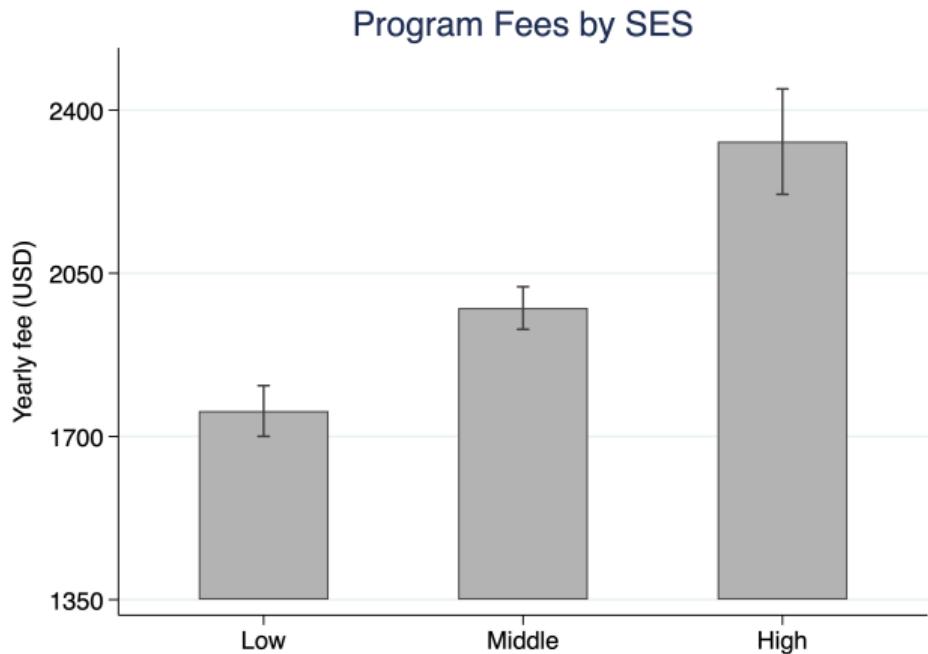

- UNAB prices each program differently
- Low-SES study in more affordable programs
- Large difference as net average monthly salary around \$350

# Selection into programs

---

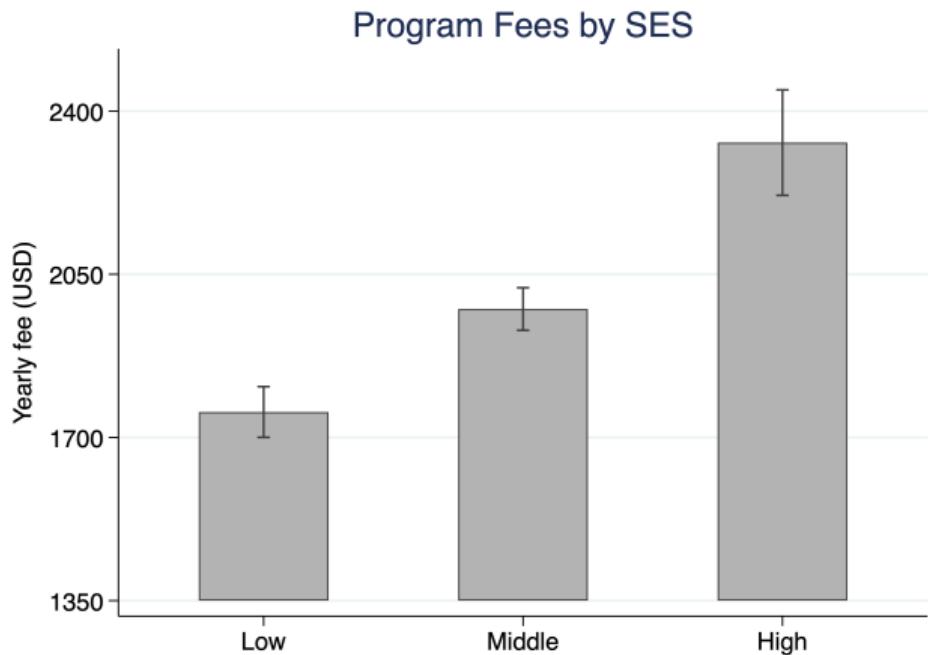

- UNAB prices each program differently
- Low-SES study in more affordable programs
- Large difference as net average monthly salary around \$350

# Selection into programs

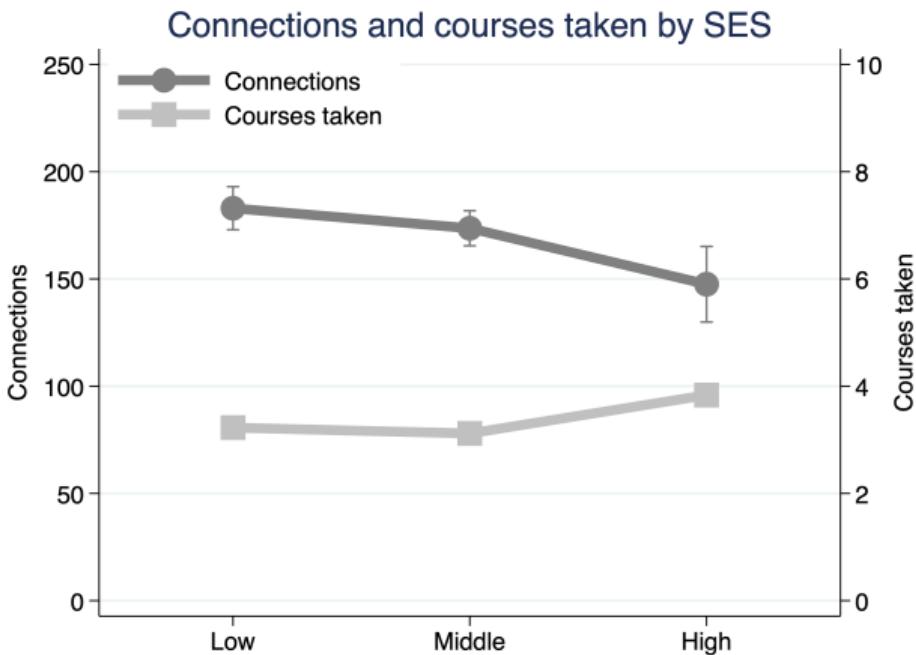

---

- UNAB prices each program differently
- Low-SES study in more affordable programs
- Large difference as net average monthly salary around \$350

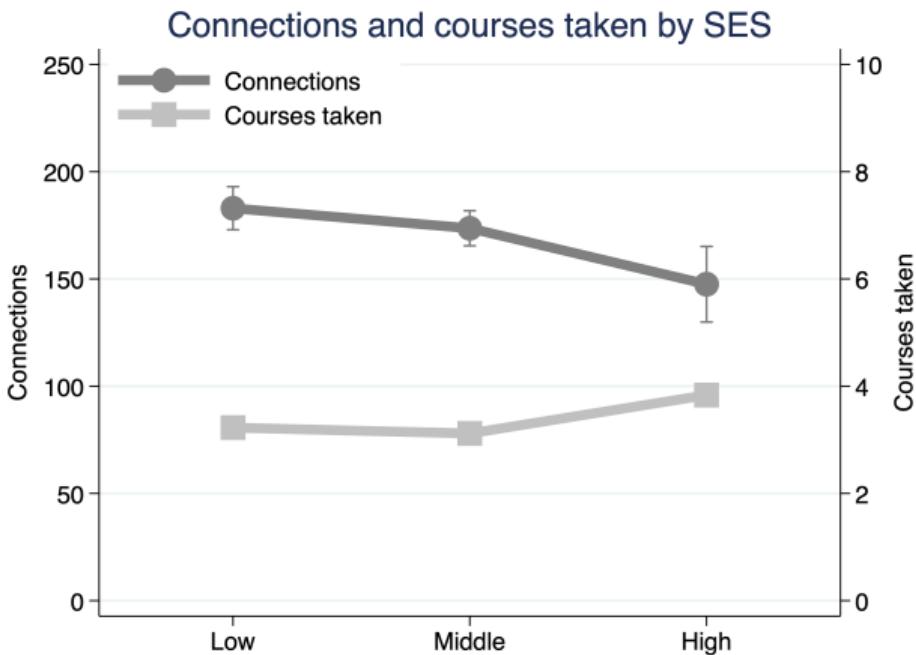

# Network dynamics by SES

- Connections decrease with SES
- Courses taken with peers increases with SES
- High-SES take more courses with their own See

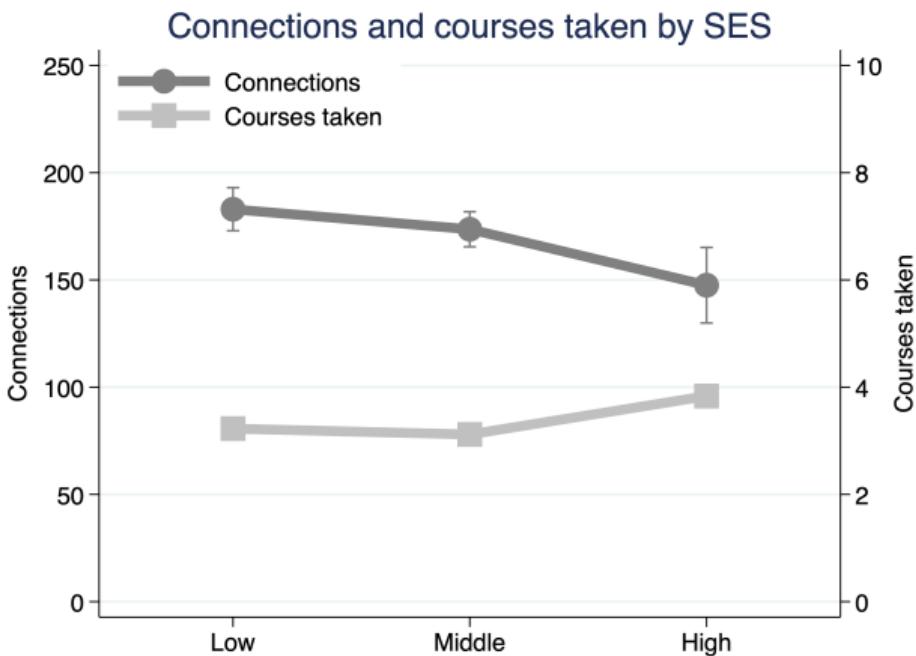

# Network dynamics by SES

- Connections decrease with SES
- Courses taken with peers increases with SES
- High-SES take more courses with their own See

# Network dynamics by SES

- Connections decrease with SES
- Courses taken with peers increases with SES
- High-SES take more courses with their own See

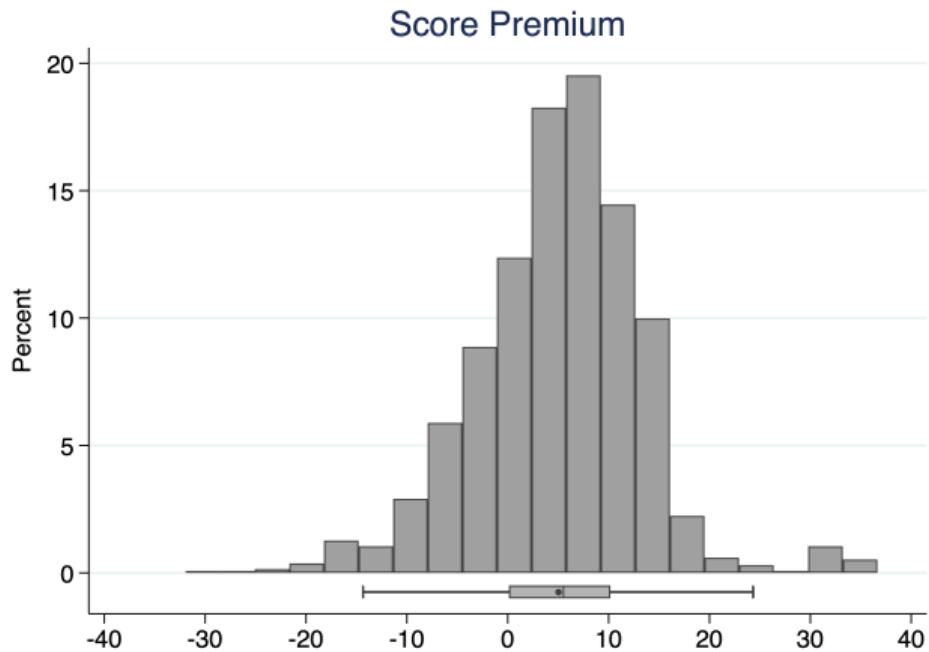

# **Descriptive Statistics II: Referrals**

# Referrals are better than network average

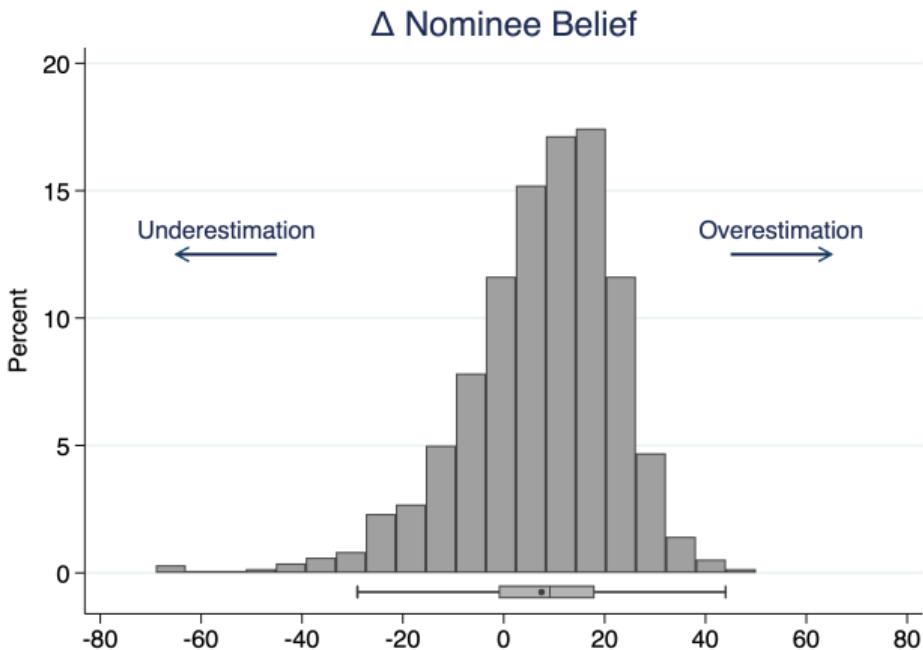

---

- Defined as nominee  $j$ 's score minus network average for each referrer  $i$  across Math and Reading
- No difference between SES groups See

# Referral score beliefs are skewed positively

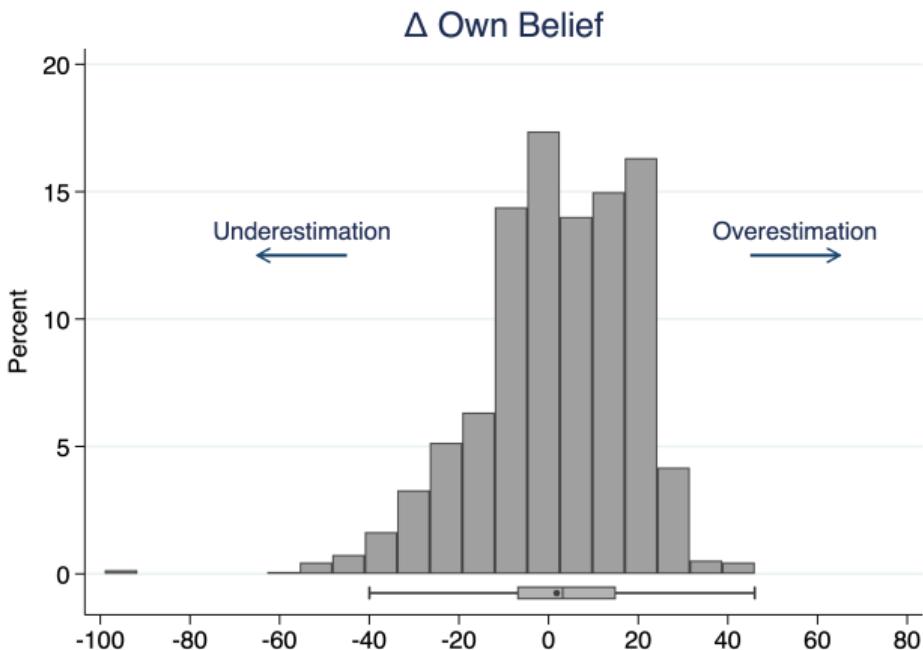

- Defined as referrer  $i$ 's beliefs about nominee  $j$  minus  $j$ 's score across Math and Reading
- No difference between SES groups See

# Own score beliefs are accurate

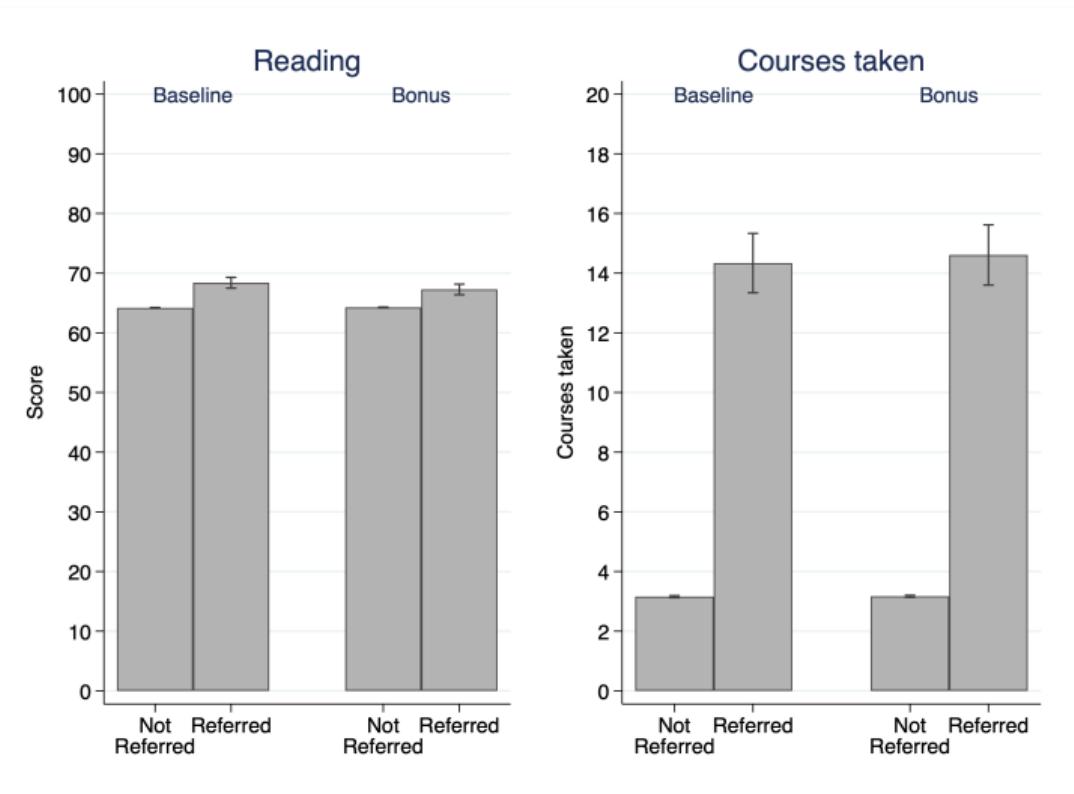

---

- Defined as referrer  $i$ 's own beliefs minus their score across Math and Reading
- No difference between SES groups See

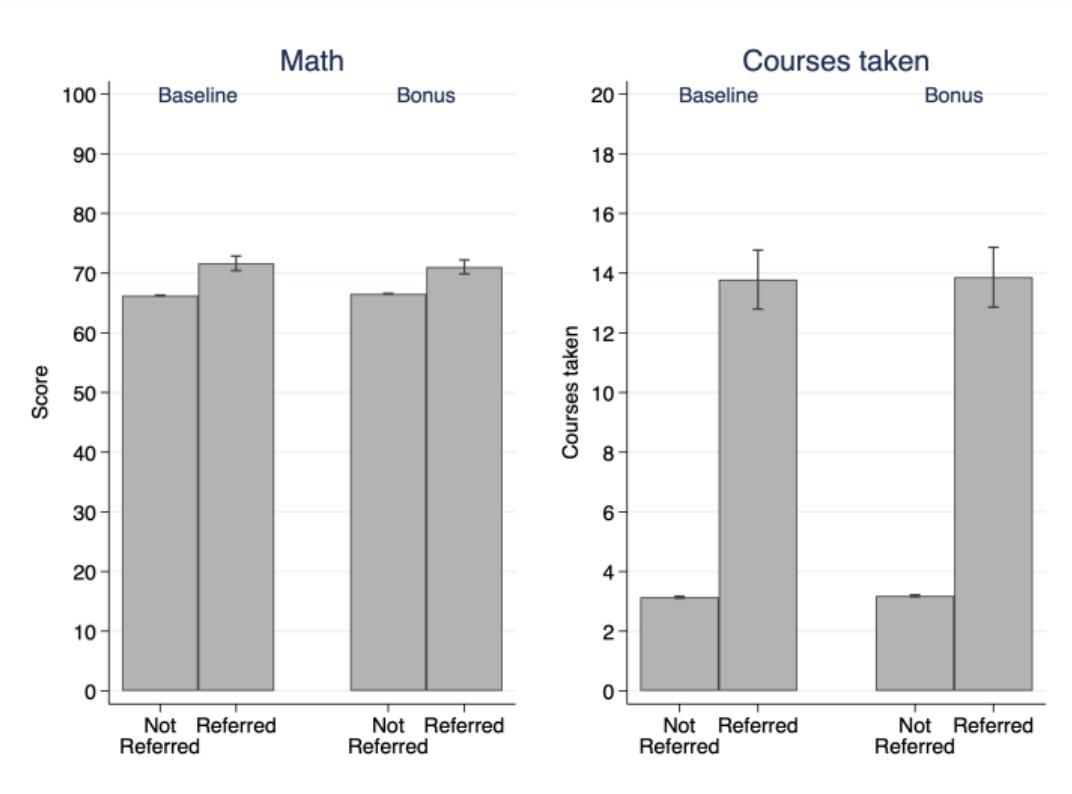

# Referrals for Reading

- Referrals have higher reading scores (.5 SD) and much higher tie strength (2.5 SD)
- No treatment effect on the referred ( $t$ -tests,  $p > 0.08$ )

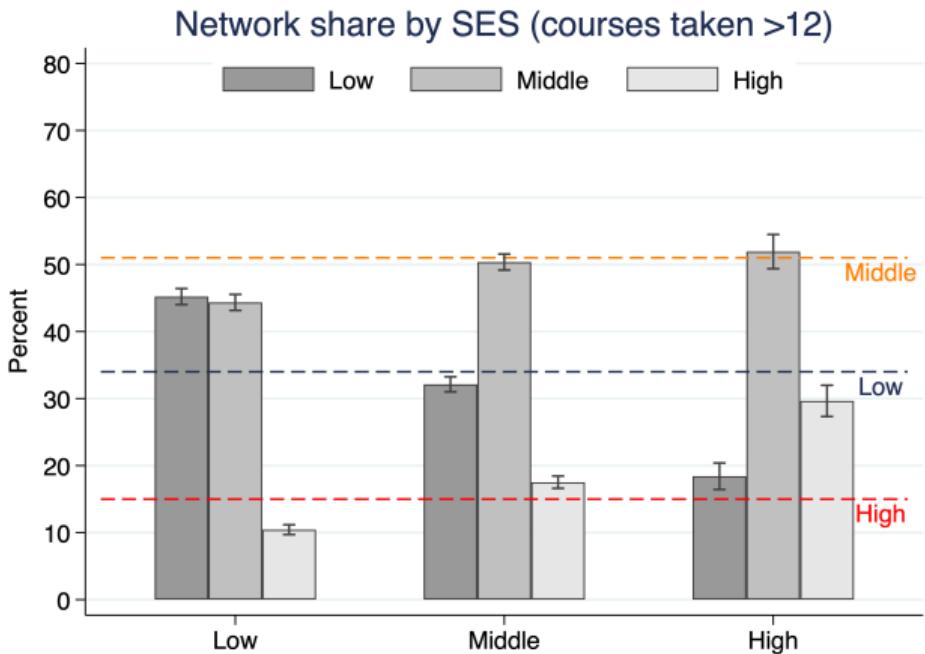

# Referrals for Math

- Referrals have higher math scores (.5 SD) and much higher tie strength (2.5 SD)
- No treatment effect on the referred ( $t$ -tests,  $p > 0.1$ )

# Ex post referral choice sets

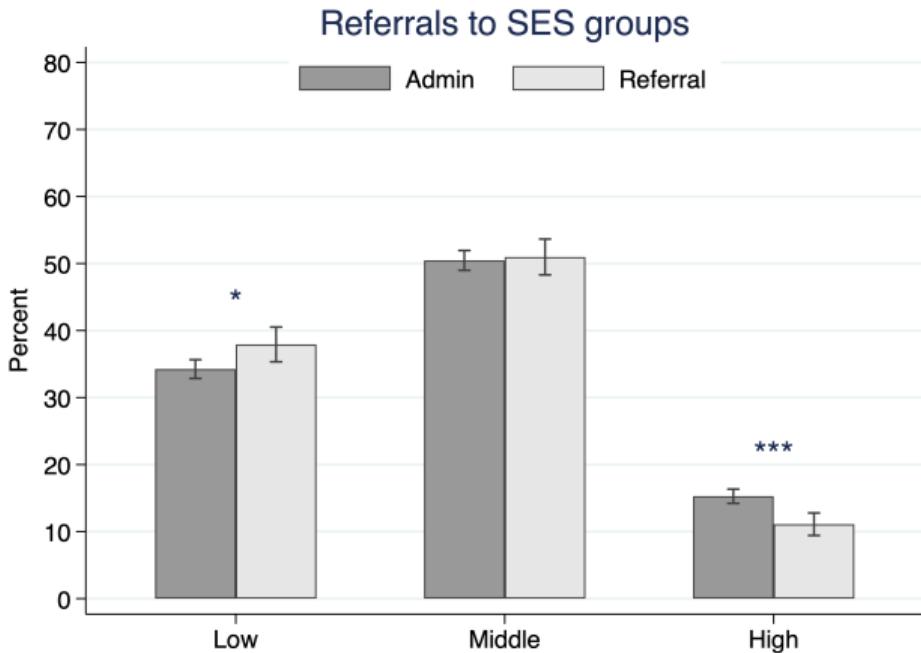

- By restricting the network to courses taken above 12, we observe large difference in referral choice sets

# Referrals are balanced

---

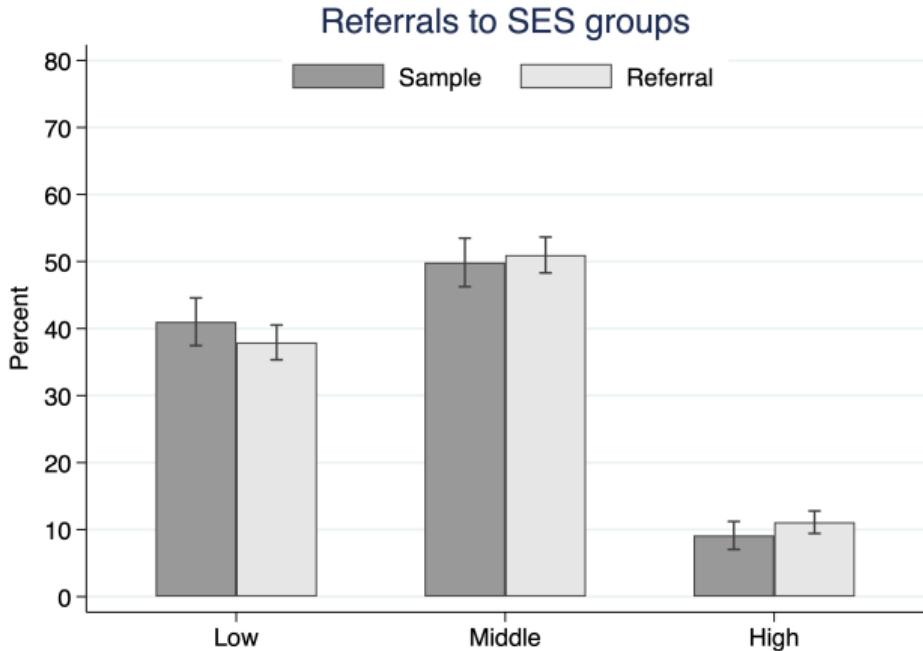

- More referrals for Low-SES and less for High-SES compared to the admin data
- No differences at the sample-level (all  $p > 0.1$ )

# Referrals are balanced

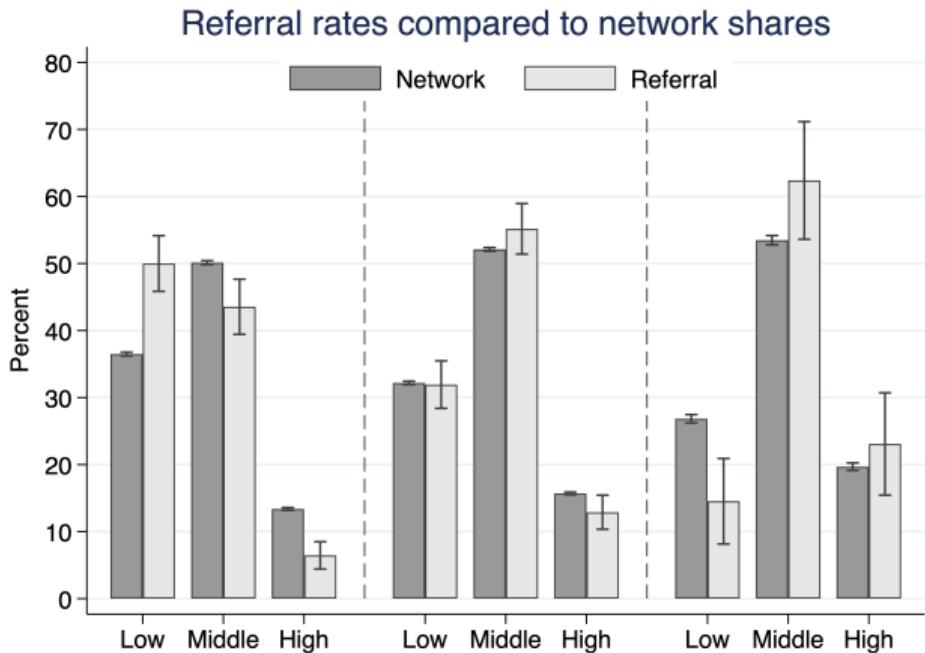

---

- More referrals for Low-SES and less for High-SES compared to the admin data
- No differences at the sample-level (all  $p > 0.1$ )

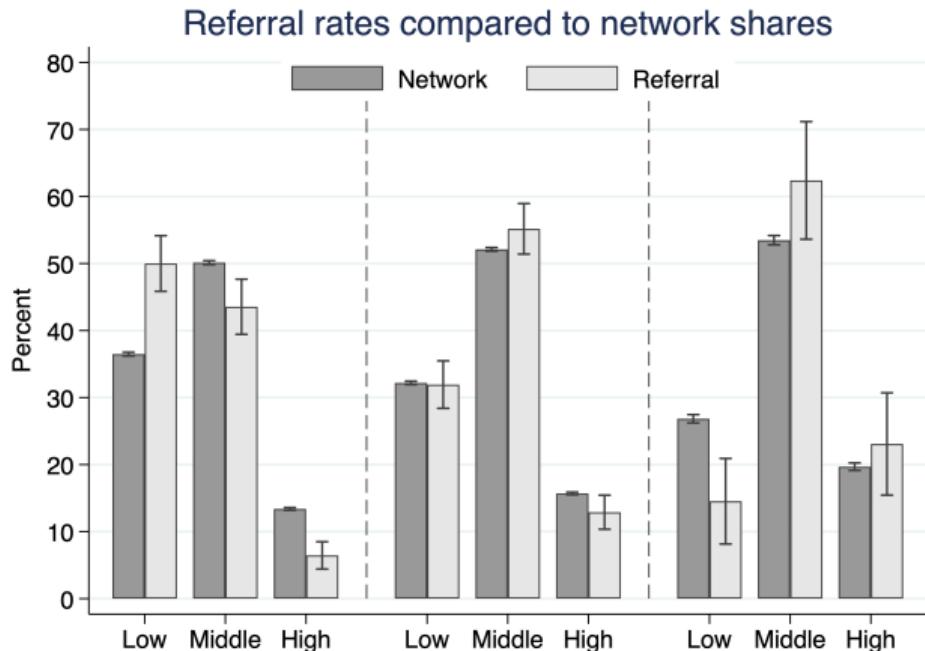

# Referral SES composition

- Stark differences in referral rates considering network compositions were imbalanced to begin with
- Do differences persist after fixing scores and classes taken?

# Referral SES composition

- Stark differences in referral rates considering network compositions were imbalanced to begin with
- Do differences persist after fixing scores and classes taken?

# Is there a SES bias in referrals?

---

## Conditional FE Logit:

$$\Pr(\text{Refer}_{ij} = 1) = \Lambda(\beta_1 \text{SES}_j + \beta_2 \text{Score}_j + \beta_3 \text{Courses taken}_{ij} + \beta_4 \text{Score}_j \times \text{Tie}_{ij} + \alpha_i)$$

- $\text{Refer}_{ij}$ : Binary outcome indicating whether individual  $i$  refers individual  $j$
- $\text{SES}_j$ : Referral  $j$  is Low, Middle, or High SES
- $\text{Score}_j$ : Standardized Math or Reading score of referral  $j$
- $\text{Courses taken}_{ij}$ : Standardized number of courses taken together for  $i$  and  $j$
- $\alpha_i$ : Individual fixed effect for referrer  $i$

# Is there a SES bias in referrals?

---

- Aggregate bias against High-SES
- Score and courses taken are strong predictors of referrals
- Small interaction between score and courses taken

# No bias against Low-SES in referrals

- **Low-SES** referrers are biased against High-SES and favor their own
- **Middle-SES** referrers are marginally biased against High-SES
- **High-SES** referrers are marginally biased against Low-SES but do not favor their own

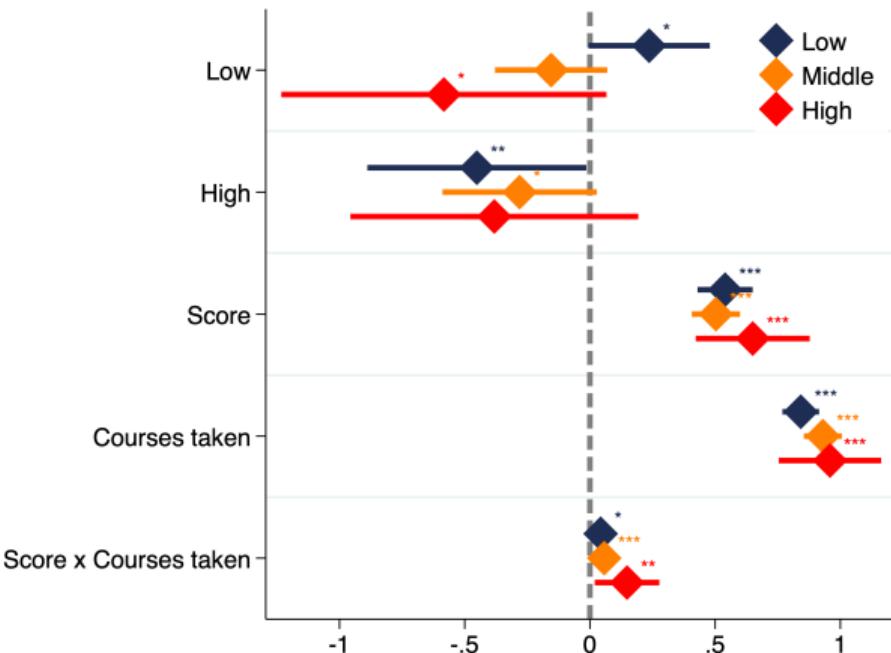

# No bias against Low-SES in referrals

- **Low-SES** referrers are biased against High-SES and favor their own
- **Middle-SES** referrers are marginally biased against High-SES
- **High-SES** referrers are marginally biased against Low-SES but do not favor their own

# No bias against Low-SES in referrals

- **Low-SES** referrers are biased against High-SES and favor their own
- **Middle-SES** referrers are marginally biased against High-SES
- **High-SES** referrers are marginally biased against Low-SES but do not favor their own

# Summary

---

- Networks are separated by SES
- Referrers refer equally well across SES, and pick close ties with higher scores
- Little to no bias in referrals in contrast to stark differences in network structures

# Summary

---

- Networks are separated by SES
- Referrers refer equally well across SES, and pick close ties with higher scores
- Little to no bias in referrals in contrast to stark differences in network structures

# Summary

---

- Networks are separated by SES
- Referrers refer equally well across SES, and pick close ties with higher scores
- Little to no bias in referrals in contrast to stark differences in network structures

# Implications

---

- Individuals across SES refer equally well with proper incentives and without bias
- Differences in network structures lie at the heart of the problem for solving inequality

# Implications

---

- Individuals across SES refer equally well with proper incentives and without bias
- Differences in network structures lie at the heart of the problem for solving inequality

# Reading

---

- Reading score and tie strength are strong predictors of referrals
- No interaction between reading score and tie strength
- No evidence for a Low-SES bias Alt. Specification
